Page 0 · Alarm Takeover: The First Mechanical State After Projection Shutdown

When the projection system shuts down,
the room does not return to clarity or neutrality.
Instead, it enters a fixed and predictable configuration:

Alarm Takeover.

1. Projection Offline ≠ Symbolic Objects Removed

Shutting down the Projector eliminates the image,
not the structure behind it.

The symbolic objects remain fully seated:

- Seat 1 (being seen / being loved)
- Seat 2 (supporting or completing the other)
- Seat 4 (shared future potential)

With the symbols still in place,
the relational field remains active.

2. Spotlight Has Not Returned → Insufficient Visibility

After projection collapse,
the Spotlight does not immediately regain luminosity.
The Core Self cannot perceive the partner accurately;

the room stays in partial darkness.

3. Residual Heat Keeps the Environment Compressed

Thermal load from projection is still present:

- elevated room temperature
- vibration from symbolic weight
- ongoing condensation from Shadow leakage
- continuous regulatory activity

The space remains in a high-pressure configuration.

4. Projection Cannot Reboot → Alarm Becomes the Dominant Module

The combination of high heat × low visibility prevents the projection system from restarting.

When projection cannot come back online, the system automatically shifts into:

Alarm mode (boundary-threat detection).

Alarm does not interpret emotion,
does not analyze meaning,
and does not evaluate intention.

Its sole computation is:

exposure density.

5. The Intimate Partner, Being the Closest Object, Is Automatically Tagged as the Primary Threat

Because symbolic objects remain seated, the partner retains the shortest internal distance to the Core Self.

Shortest distance → highest exposure →
highest threat score.

Alarm applies this classification without hesitation or nuance.

Summary

Once projection shuts down, Alarm comes online.

And the closest person is always tagged as the highest-exposure threat source.

Page 1 · Mirror Activation: Why One Alarm Always Triggers the Other

After projection shuts down, the Alarm becomes the system's primary module. Once one partner's Alarm activates, the other's activation is mechanically inevitable.

This is not emotional reciprocity;
it is Output–Input Coupling between two systems.

1. When One Alarm Activates → Defensive Output Is Unavoidable

The Alarm never operates silently.

Once a threat is tagged, the system produces defensive behaviors:

- contraction
- coldness
- withdrawal
- heightened reactivity
- hardened tone

These are defensive outputs, not emotions.

2. With the Spotlight Half-Lit, Intention Is Unreadable

Because the Spotlight has not regained normal luminosity,

the partner cannot perceive intention—only behavior.

Only behavioral signals enter the system.

In partial darkness, all deviations are classified as:

inconsistent → unpredictable → threatening.

3. Defensive Output = Perceived Aggression Input

The defensive signals produced by the first system

are received by the second system as:

- aggression
- rejection
- hostility
- distancing
- disruption

Thus:

your defense = their aggression input.

4. Aggression Input Automatically Triggers the Partner's Alarm

No emotional interpretation is required.

The Alarm module treats aggression-tagged signals as direct threat stimuli.

Therefore:

A's Alarm activates → A outputs defense

A's defense → B receives aggression

B receives aggression → B's Alarm activates

This chain is mechanical.

5. Both Alarms Lock Into Double-Alarm Coupling

Once both Alarms are active:

- your defense = their threat
- their defense = your threat

- each reaction amplifies the other
- the system becomes a closed loop
- the cycle cannot stop on its own

This configuration is known as:

Double-Alarm Coupling.

Summary

In intimate systems, defense never happens alone.
One Alarm always pulls the other into activation.

Page 2 · Symbolic Locking: Why Two People Cannot Disconnect When the Symbols Are Still in Place

Projection shutdown does not terminate the relational field.

As long as symbolic objects remain seated,
the system cannot transition into an exit state.

Symbolic Locking is the structural mechanism
that holds the two systems in place.

1. Symbolic Objects Still Occupy Seats 1 / 2 / 4 → The Relationship Remains Active

Projection is offline,
but the symbolic framework remains intact:

- Seat 1: being seen / being held
- Seat 2: sustaining or completing the partner
- Seat 4: shared future potential

If symbols remain seated,
the relationship remains mechanically active.

2. Residual Heat Prevents Exit → The System Has No Spare Energy

The room remains in high-pressure mode:

- temperature elevated
- Shadow leakage persisting
- symbolic vibration ongoing
- regulation still active

Exiting requires free energy.

But all energy is consumed by:

- Alarm
- defensive output
- misinterpretation
- boundary maintenance

The system can maintain,
but it cannot withdraw.

3. Half-Lit Spotlight → Misinterpretation Dominates → Repair Impossible

With insufficient visibility:

- all actions are classified as threat
- all deviations are amplified
- all communication collapses into misreading

Repair cannot be computed
under partial illumination.

4. The Alarm Pushes Away, but the Symbols Pull Inward

Two forces collide:

- Alarm: increase distance
- Symbols: maintain connection

This creates a mechanical contradiction:

- pulled close
- pushed away

- overheated
- trapped

Not emotional confusion—
a literal force conflict.

5. The System Outcome: No Exit, No Closure, No Clarity, No Separation

With symbols still seated:

- exit cannot occur
- detachment cannot complete
- repair cannot start
- the field cannot collapse

The relationship becomes stuck
in a midline orbit:
neither forward nor backward.

Summary

As long as the symbolic objects remain in place,
the relationship cannot conclude—even when both systems are in
pain.

The intimate–adversary configuration is not the predetermined end of a
relationship,
but it is the final mechanical checkpoint the system must pass.
Beyond this point, the system has completed its computation;
what happens next—repair or separation—
depends on the individuals, not the architecture.

For the system, this is the end of the line.
